

**Can the balloon bear
The rain ? The wind ?
Very high temperatures ?
Very low ones ?
Is it fragile ?**

The envelopes of the balloon are made of complex textures to give the balloon a long lifetime.

These textures are ripstop, tight and resistant to weather conditions (rain or snow)

Resistance to the wind

Airstar balloons have a resistance to the wind in proportion with their size and their lift (for more details you can go and see the technical leaflets of each product)

In the case of helium balloons, anchorage allows to attach the balloon.

The self-inflating balloons are fixed on stands that give them more resistance.

Resistance to temperature

The variations of temperature only have an effect on helium balloons. A difference in temperature can make the helium volume vary.
